Week 4 - Lecture 21

Regret bound of ForeL

We showed for FTL that

We showed for
$$F(L)$$
 and
$$\sum_{t=1}^{\infty} J_t(\omega_t) - \sum_{t=1}^{\infty} J_t(\omega_t) = \sum_{t=1}^{\infty} J_t(\omega_t) - \sum_{t=1}^{\infty} J_t(\omega_t) = \sum_{t=1}^{\infty} J_t(\omega_$$

Lemma: Let ω_1, ω_2 - . be a sequence of vectors produced by FoReL.

Then YuES

$$\frac{\tilde{r}}{\tilde{r}}\int_{\xi}(\omega_{t}) - \frac{\tilde{s}}{\tilde{r}}\int_{\xi}(\omega) \leq \frac{\tilde{r}(\omega) - \tilde{r}(\omega_{1})}{\tilde{r}} + \frac{\tilde{s}}{\tilde{r}}\int_{\xi}(\omega_{t}) - \frac{\tilde{s}}{\tilde{r}}\int_{\xi}(\omega_{\epsilon+1})$$

ForeL Algo:

argmin
$$\underset{i=1}{\overset{t}{\leq}} j_i(\omega) + \mathcal{R}(\omega)$$

Let this be $j_o(\omega)$ $\begin{bmatrix} j_t(\omega) & \text{at} \\ t=0 & \text{at} \end{bmatrix}$

So then eq. 1 becomes:

$$\sum_{t=0}^{n} \int_{t} (\omega_{t}) - \sum_{t=0}^{n} \int_{t} (u) \leq \sum_{t=0}^{n} \int_{t} (\omega_{t}) - \sum_{t=0}^{n} \int_{t} (\omega_{t+1})$$

$$=\int_{0}^{\infty}\int_{0}^{\infty}(\omega_{0})-\int_{0}^{\infty}(\omega)$$

$$+\sum_{t=1}^{\infty}\int_{t}^{\infty}(\omega_{t})-\sum_{t=1}^{\infty}\int_{t}^{\infty}(\omega_{t})$$

$$+\sum_{t=1}^{\infty}\int_{t}^{\infty}(\omega_{t})-\sum_{t=1}^{\infty}\int_{t}^{\infty}(\omega_{t})$$

$$= \sum_{t=1}^{n} \int_{t} (\omega_{t}) - \sum_{t=1}^{n} \int_{t} (u) \leq \int_{0} (u) - \int_{0} (\omega_{t}) + \sum_{t=1}^{n} \int_{t} (\omega_{t}) - \sum_{t=1}^{n} \int_{t} (\omega_{t+1}) + \sum_{t=1}^{n} \int_{t} (\omega_{t}) = R(\omega_{t})$$

$$= \sum_{t=1}^{n} \int_{t} (\omega_{t}) - \sum_{t=1}^{n} \int_{t} (\omega_{t+1}) + \sum_{t=1}^{n} \int_{t} (\omega_{t}) = R(\omega_{t})$$

$$= \sum_{t=1}^{n} \int_{t} (\omega_{t}) - \sum_{t=1}^{n} \int_{t} (\omega_{t}) + \sum_{t=1}^{n} \int_{t} (\omega_{t})$$

Thus we get back eq. 1

Now in order to work out the regret bound, let

$$R(\omega) = \frac{1}{2\eta} ||\omega||^2$$
 and for $\int_{t}^{t} (\omega) = \langle \omega, z_t \rangle$
also let $S \in \mathbb{R}^n$

 $R(n, F_0 R_{eL}, u) \leq R(u) - R(\omega) + \sum_{t=1}^{\infty} \int_{t} (\omega_t) - \sum_{t=1}^{\infty} \int_{t} (\omega_t) dt$ Thus,

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle w_{t} z_{t} \rangle$$

$$- \sum_{t=1}^{n} \langle w_{t+1} z_{t} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

$$= \frac{1}{2\eta} ||u||^{2} + \sum_{t=1}^{n} \langle \omega_{t} - \omega_{t+1} \rangle |^{2} \rangle$$

Thus:

$$R(n, FoReL, u) \leq \frac{1}{2} ||u||^2 + \eta \lesssim \frac{1}{t=1} ||Z_t||_2^2$$

Let
$$||Z_t||_2^2 \le L + t$$
; $U = \{U : ||u||_2^2 = B\}$

Then:

$$R(n, F_0ReL, u) \leq \frac{1}{2\eta}B + \eta \stackrel{\sim}{\underset{r=1}{\not}} L$$

Now in order to choose an appropriate of, we need to differentiate twice, find out the slope wirt of and then choose the appropriate of

Hence
$$\eta = \sqrt{\frac{B}{2L\eta}}$$

Linearization of convex functions

Def & of a convex function:

$$\int (\lambda x + (1-\lambda)y) \leq \lambda \int (x) + (1-\lambda) \int (y) \quad -3$$

at
$$\lambda = 0$$

$$\int (\lambda x + (1-\lambda)y) = \int (y)$$

where

$$\frac{1}{\lambda} \int_{\alpha}^{\alpha} \frac{1}{\omega} y$$

$$\frac{1}{\lambda(\alpha) + (1-\lambda)y} = \frac{1}{\lambda(\alpha)} (\lambda + (1-\lambda)y) = \frac{1}{\lambda(\alpha)} (\lambda +$$

Thus what (3) says is that $f(\lambda(x)+(1-\lambda)y)$ will lie within $J(x) \land J(y) [\lambda \in [0,1]]$

Also at any paint w, we can draw a tangent, which would be a lower bound on the convex function

Lemma: Let S be a convex set. A function J: S -> R is convex

iff \w∈S Jz s.t.

 $\forall u \quad J(u) \geq J(\omega) + \langle u - \omega, z \rangle$ (F) This z is called sub-gradient of of at w. Denoted on of (w)

-> If I is differentiable and of (w) is a singleton then it is denoted as $\nabla J(\omega)$

At w, function is not differentiable.

We can have various z satisfying

the Lemma, hence at "

h-

However at point y, it is differentiable hence we have only one Z and that's the gradient

Lemma (3) can be used to linearize any convex function N 1 () - N 1 1 'C COURS

$$R_{n} = \underbrace{\sum_{t=1}^{\infty} J_{t}(\omega_{t})}_{t=1} - \underbrace{\sum_{t=1}^{\infty} J_{t}(u)}_{t=1}$$

$$\leq < \omega_{t} - u, Z_{t} >$$

$$= < \omega_{t}, Z_{t} > - < u, Z_{t} >$$

L'differentiable
everywhere,

Now: Zt = 1/6

Thus any function can be linearized.

Then the bound for linear function derived before

Can be utilized for any convex function.

Hence with FoReL we can use the Online Gradient Descent algorithm. (with LZ Regularizer)

Online Gradient Descont

Parameter n > 0

initialize W_E = 0

update rule $\omega_{t+1} = \omega_t - \eta Z_t$ where $Z_i \in \partial J_t(\omega_t)$
